Founder: Prof. Dr. S. B. Mujumdar, M. Sc., Ph. D. (Awarded Padma Bhushan and Padma Shri by President of India)

● Experiment No.: 7

1. Title: Perform DOM traversal and updates; develop a to-do list app with add, edit, and delete features.

2. Software/Tools Required:

1. Visual Studio Code (VS Code)
2. Google Chrome
3. HTML5
4. JavaScript
5. CSS

3. Theory: The Document Object Model (DOM) represents an HTML document as a tree of elements that JavaScript can access and modify dynamically. DOM traversal allows navigation through parent, child, and sibling elements using methods such as `getElementById()`, `querySelector()`, `parentNode`, and `children`. DOM updates enable adding, editing, and deleting elements without reloading the webpage. In a to-do list application, users can create new tasks, edit existing tasks, and remove completed or unwanted tasks. This experiment demonstrates dynamic webpage manipulation, event handling, and interactive user interface development using JavaScript.

4. Output:

5. Result/Conclusion:

The to-do list application was successfully developed using JavaScript DOM manipulation techniques. It allows users to add, edit, and delete tasks dynamically without refreshing the page. The program demonstrates effective DOM traversal, event handling, and real-time updates to the user interface. This experiment improves understanding of interactive web development and dynamic content management using JavaScript.
